Question **1**

Correct

Mark 20.00 out of 20.00

Write a python program to calculate the length of the given string using recursion

For example:

Test	Input	Result
length(str)	saveetha	length of saveetha is 8
length(str)	engineering	length of engineering is 11

Answer: (penalty regime: 0 %)

```
def length(str):
    print(f"length of {str} is {len(str)}")
a=input()
str=str(a)

```

	Test	Input	Expected	Got	
✔	length(str)	saveetha	length of saveetha is 8	length of saveetha is 8	✔
✔	length(str)	engineering	length of engineering is 11	length of engineering is 11	✔
✔	length(str)	Welcome	length of Welcome is 7	length of Welcome is 7	✔

Passed all tests! ✔

Correct

Marks for this submission: 20.00/20.00.

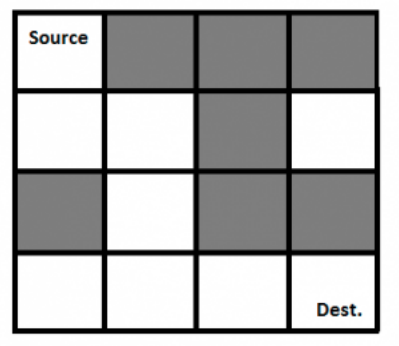
Question **2**

Correct

Mark 20.00 out of 20.00

Rat In A Maze Problem

You are given a maze in the form of a matrix of size n * n. Each cell is either clear or blocked denoted by 1 and 0 respectively. A rat sits at the top-left cell and there exists a block of cheese at the bottom-right cell. Both these cells are guaranteed to be clear. You need to find if the rat can get the cheese if it can move only in one of the two directions - down and right. It can't move to blocked cells.



Provide the solution for the above problem Consider n=4)

The output (Solution matrix) must be 4*4 matrix with value "1" which indicates the path to destination and "0" for the cell indicating the absence of the path to destination.

Answer: (penalty regime: 0 %)

Reset answer

```
N = 4

def printSolution( sol ):

    for i in sol:
        for j in i:
            print(str(j) + " ", end ="")
        print("")

def isSafe( maze, x, y ):

    if x >= 0 and x < N and y >= 0 and y < N and maze[x][y] == 1:
        return True

    return False

def solveMaze( maze ):

    # Creating a 4 * 4 2-D list
```

	Expected	Got	
✔	1 0 0 0 1 1 0 0 0 1 0 0 0 1 1 1	1 0 0 0 1 1 0 0 0 1 0 0 0 1 1 1	✔

Correct

Marks for this submission: 20.00/20.00.

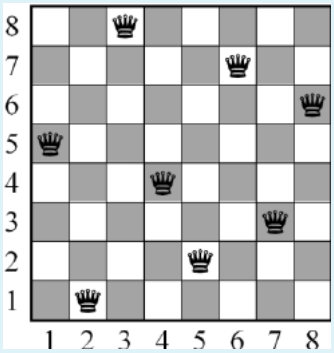
Question **3**

Correct

Mark 20.00 out of 20.00

You are given an integer **N**. For a given **N** x **N** chessboard, find a way to place **'N'** queens such that no queen can attack any other queen on the chessboard.

A queen can be attacked when it lies in the same row, column, or the same diagonal as any of the other queens. **You have to print one such configuration**.



Note :

Get the input from the user for N . The value of N must be from 1 to 8

If solution exists Print a binary matrix as output that has 1s for the cells where queens are placed

If there is no solution to the problem print "Solution does not exist"

For example:

Input	Result
5	1 0 0 0 0 0 0 0 1 0 0 1 0 0 0 0 0 0 0 1 0 0 1 0 0

Answer: (penalty regime: 0 %)

Reset answer

```
global N
N = int(input())

def printSolution(board):
    for i in range(N):
        for j in range(N):
            print(board[i][j], end = " ")
        print()

def isSafe(board, row, col):

    # Check this row on left side
    for i in range(col):
        if board[row][i] == 1:
            return False

    # Check upper diagonal on left side
    for i, j in zip(range(row, -1, -1),
                    range(col, -1, -1)):
        if board[i][j] == 1:
            return False

```

	Input	Expected	Got	
✔	5	1 0 0 0 0 0 0 0 1 0 0 1 0 0 0 0 0 0 0 1 0 0 1 0 0	1 0 0 0 0 0 0 0 1 0 0 1 0 0 0 0 0 0 0 1 0 0 1 0 0	✔
✔	2	Solution does not exist	Solution does not exist	✔

	Input	Expected	Got	
✔	8	1 0 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 0 1 0 1 0 0 0 0 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 1 0 0 0 0 1 0 0 0 0 0	1 0 0 0 0 0 0 0 0 0 0 0 0 0 1 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 0 1 0 1 0 0 0 0 0 0 0 0 0 1 0 0 0 0 0 0 0 0 0 1 0 0 0 0 1 0 0 0 0 0	✔

Question **4**

Correct

Mark 20.00 out of 20.00

SUBSET SUM PROBLEM

COUNT OF SUBSETS WITH SUM EQUAL TO X

Given an array arr[] of length N and an integer X, the task is to find the number of subsets with a sum equal to X.

Examples:

Input: *arr[] = {1, 2, 3, 3}, X = 6*
Output: *3*
All the possible subsets are {1, 2, 3},
{1, 2, 3} and {3, 3}

Input: *arr[] = {1, 1, 1, 1}, X = 1*
Output: *4*

THE INPUT

1.No of numbers

2.Get the numbers

3.Sum Value

For example:

Input	Result
4 2 4 5 9 15	1
6 3 34 4 12 3 2 7	2

Answer: (penalty regime: 0 %)

Reset answer

```
def subsetSum(arr, n, i,sum, count):
    if i==n:
        if sum==0:
            count+=1
        return count
    count=subsetSum(arr,n,i+1,sum-arr[i],count)
    count=subsetSum(arr,n,i+1,sum,count)
    return count
#Write your code here

arr=[]
size=int(input())
for j in range(size):
    value=int(input())
    arr.append(value)
sum = int(input())
n = len(arr)

print(subsetSum(arr, n, 0, sum, 0))
```

	Input	Expected	Got	
✔	4 2 4 5 9 15	1	1	✔
✔	6 10 20 25 50 70 90 80	2	2	✔
✔	5 4 16 5 23 12 9	1	1	✔

Passed all tests! ✔

Correct

Marks for this submission: 20.00/20.00.

Question **5**

Incorrect

Mark 0.00 out of 20.00

Greedy coloring doesn't always use the minimum number of colors possible to color a graph. For a graph of maximum degree x, greedy coloring will use at most x+1 color. Greedy coloring can be arbitrarily bad;

Create a python program to implement graph colouring using Greedy algorithm.

For example:

Test	Result
colorGraph(graph, n)	Color assigned to vertex 0 is BLUE Color assigned to vertex 1 is GREEN Color assigned to vertex 2 is BLUE Color assigned to vertex 3 is RED Color assigned to vertex 4 is RED Color assigned to vertex 5 is GREEN

Answer: (penalty regime: 0 %)

Reset answer

```
class Graph:
    def __init__(self, edges, n):
        self.adjList = [[] for _ in range(n)]

        # add edges to the undirected graph
        for (src, dest) in edges:
            self.adjList[src].append(dest)
            self.adjList[dest].append(src)
def colorGraph(graph, n):
    ############ Add your code here ##############
if __name__ == '__main__':
    colors = ['', 'BLUE', 'GREEN', 'RED', 'YELLOW', 'ORANGE', 'PINK',
              'BLACK', 'BROWN', 'WHITE', 'PURPLE', 'VOILET']
    edges = [(0, 1), (0, 4), (0, 5), (4, 5), (1, 4), (1, 3), (2, 3), (2, 4)]
    n = 6
    graph = Graph(edges, n)
    colorGraph(graph, n)
